

ABSTRACT OF THE DISCLOSURE

A medicine envelope feeder capable of feeding a sufficient quantity of medicine envelopes while preventing injection medicine containers from leaking out of the medicine envelopes even if the shape of a bucket is of a general type. One face of the medicine envelope (3) is supported by a support member (5), excluding a tolerance for bending starting from an upper end opening part. The other face of the medicine envelope (3) is guided by a guide part (26) of a vertically movable holding member (6), and the medicine envelope (3) is folded along the support member (5) and pressed by lowering a vertically movable pressing part (27) along the guide part (26). Since the coefficient of friction of the pressing part (27) is larger than that of the support member 5, only the medicine envelope (3) can be raised while being held between the guide part (26) and the pressing part (27) when the holding member (6) is raised.
